Dental implants

Are made of titanium and they serve as the tooth root to replace one or more missing teeth.

For a single missing tooth;

Chewing function is totally restored without damaging the adjacent teeth.

For multiple missing teeth;

Instead of a removable denture, suitable implants are placed into the spaces of missing teeth, restoring all chewing function and preventing bone loss.

For edentulous patients (Removable denture);

The retention of complete dentures decrease throughout time and they cause bone loss. Denture retention is achieved by the implementation of 2 or 4 implants.

For edentulous patients (Fixed partial denture);

In edentulous patients, implants can be applied to both the lower and upper jaw to totally restore chewing function and to achieve an aesthetic appearance.

Protection of adjacent teeth and dentine;

Dental Implants provide a healthier life by filling the missing tooth cavity without damaging the adjacent teeth and preventing bone loss.

A more comfortable dental prosthesis;

By means of Dental Implants, your life can be more comfortable while you are eating, smiling or talking with the help of implant supported prostheses.

Lifetime guarantee;

BioSTI Implants are produced in compliance with Swiss quality by experienced professionals. They comply with international standards and have a lifetime guarantee
